

Used Parts for Forklifts

Used Parts for Forklift - Eventually, lift truck parts will wear and need to be replaced. Acquiring brand new components can become a costly undertaking so one more idea is to obtain used forklift parts. This can save a lot of money in the long run. It is a great idea to acquire used lift truck parts that have been reproduced. These parts would guarantee that you are getting components that would work for a long time and be productive.

Remanufacturing broken and worn out components is a cheaper way overall than rebuilding. With rebuilding parts, only the components which are worn out or broken get changed, which means that other wearable parts could break down soon after purchase.

Remanufacturing on the other hand offers the best guarantee for used parts. Reproduced components are taken apart and cleaned and then all wearable pieces are replaced. All wearable parts are replaced regardless of age or wear which is another rationale why remanufactured components generally run so much better. Any component within the part is new and this offers much longer life to the second-hand part. Depending on the forklift parts that are being redone, the cleaning process and the whole remanufacturing process would differ.

The engines are cleaned after a complete disassembly. Various engine parts like for example rings, pistons, spark plugs, valve springs, filters, and valves can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to guarantee that there are no noise, no oil pressure problems, no leaks or any vacuum.

Transmissions are another item that is oven cleaned after being disassembled. The transmission is then pressure washed. A comprehensive examination is done in order to check for any cracks. Bearings, bushings and seals are all replaced. Normally, the replacement components used on transmission components meet OEM specifications.

Certain lift truck components such as the water pump, torque converters, the alternator, steer axles and the starter could be quite serviceable after worn components are replaced. The electronic control in the electric lift truck is maintained by the control card. This particular card could also be reproduced with replacing all aged and worn out components. Not like different lift truck components the control card could only have the worn and aged parts replaced.

Components that are reproduced have to be comprehensively inspected upon reassembly to guarantee they are in good condition before being sold. When obtaining these components, it is a good idea to be sure that they have undergone all of the proper testing and inspections. On certain larger parts such as steer axles, engines and transmissions, OEM specification replacement components must be utilized.

The dealer of used forklifts and parts can ensure that the remanufactured components have met OEM specifications and that these parts meet industry standards. Many details go into remanufacturing used parts. This attention to detail offers more serviceability out of remanufactured parts compared to the components that were simply rebuilt.
